

C S 519 Applied Machine Learning

Convolutional Neural Networks

1. Objective

In this **individual** homework, you are required to design Convolutional Neural Networks (CNNs).

2. Requirements

2.1 Tasks

- (1) [25 points] Design a CNN architecture with the following configuration and draw the CNN architecture in a similar manner as in the notes. Put the CNN architecture to the **report** file.
 - a) Create the first convolutional layer using kernel size 3×3 , strides 1×1 , valid padding mode, and output channel size 4.
 - b) Create the first pooling layer using max pooling with pooling size 2×2 and strides 2×2 .
 - c) Create the second convolutional layer using kernel size 3×3 , strides 3×3 , valid padding mode, and output channel size 2.
 - d) Create the second pooling layer using max pooling with pooling size 4×4 , and strides 4×4 .
 - e) Create a fully connected layer from the second pooling layer with output channel size 10.

Note: the input dimension need to match the data you use in the code.
- (2) [35 points] Write code using PyTorch to implement this CNN. You can directly copy code provided in the class/textbook and make changes.
- (3) [20 points] Test your CNN using the MNIST dataset in the torchvision module.
- (4) [15 points] Properly analyze the performance of the CNN if you change some parameters. For example, if you change the kernel size, pooling functions, etc., how does that affect your prediction accuracy and training time. Put your analysis to the **report.pdf** file.
- (4) [5 points] Write a readme file **readme.txt** with detailed instructions to run your program.

2.2 Other requirements

- Your Python code should be written for Python version 3.10 or higher.
- Please write proper comments in your code to help the instructor and teaching assistants to understand it.
- Please properly organize your Python code (e.g., create proper classes, modules). You can put your code to Jupyter Notebook or a .py file.

3. Submission instructions

Put all your files (Python code, readme file, report, datasets, etc.) to a zip file named **hw8_<YourName>.zip** and upload it to Canvas.

4. Grading criteria

- **ZERO point** will be given if your code does not work. Please do not submit code that you did not test and make sure it works.
- The score allocation has been put beside the questions.

- FIVE points will be deducted if files are not submitted in the required format.
- If the total points are more than 100. Your grades will be scaled to the range of [0,100].
- Please make sure that you test your code thoroughly by considering all possible test cases.
